

This was the most complex game project I've worked on for this class, so it was much more of a challenge getting all the different systems working.

This was also the first time in all of these games where I created/formed my own assets instead of using a precompiled asset file which also posed challenges of its own, as I had to find everything I wanted, create materials, edit picture files, etc. The art direction of this game is what I'm most proud of, as I think it looks very unique and almost exactly how I envisioned it. All assets were png images taken off of google, which I then edited myself to remove backgrounds, edit them in whatever way I needed, and slightly pixelated them to fit with the games theme. This approach is much more fun than what I had done on previous projects, as I had complete control over the game's visuals. I also tried a lot harder than I did in my previous platform game to make this one unique and complex, as this was one of the genres I was most excited for.

In regard to what broke, a lot of the time it was just the fact that I had a lot of complex interlinking systems in the game. The hardest to get working was the various menus I have in the survival portion of the game, as it took me a while to get them working and interactable, as well as updating properly. I also ran into an issue the day before the project was due where my unity had crashed after working for many hours straight, and when it crashed it had not saved anything I put in the scene view for that entire day. Luckily it saved all of my assets and scripts, but if I had to do anything different it would definitely be whatever I did to make my unity crash to save myself all that pain and struggle remaking the entire scene.

Other than that I am satisfied with my game. It may still be a bit buggy and not perfectly responsive, but it looks and feels exactly how I imagined when I planned it.
